

**Crosstabs****October 2020 University of Massachusetts Amherst Poll of Likely Voters**

<b>Field Dates:</b>	October 20 – October 27, 2020
<b>Sample:</b>	1,500 Likely Voters in the United States Oversample of White Working Class Voters (N=500)
<b>Margin of Error:</b>	3.1% for All Likely Voters

YouGov interviewed 1,792 respondents who were then matched down to a sample of 1,667 registered voters and then subset on 1,500 likely voters to produce the final dataset. The likely voter subset included an oversample of 500 white voters with lower educational attainment.

The full set of survey starts were matched to a sampling frame of registered voters on gender, age, race, and education. The frame was constructed by stratified sampling from the registered voter portion of the 2016 Current Population Survey sample with selection within strata by weighted sampling with replacements (using the person weights on the public use file).

The matched cases were weighted to the sampling frame using propensity scores. The matched cases and the frame were combined and a logistic regression was estimated for inclusion in the frame. The propensity score function included age, gender, race/ethnicity, and years of education. The propensity scores were grouped into deciles of the estimated propensity score in the frame and post-stratified according to these deciles.

The weights were then post-stratified on 2016 Presidential vote choice, and a four-way stratification of gender, age (4-categories), race (4-categories), and education (4-categories). Finally, the weights were subset on likely voters and trimmed and re-centered to produce the final weight.
